

EPIGENETICS

ABclonal Antibody (IV)

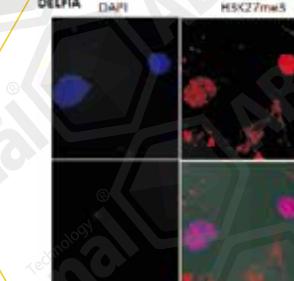

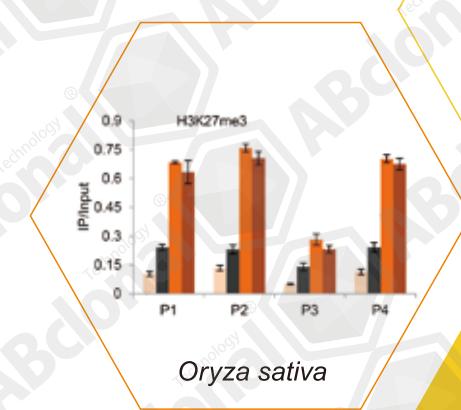

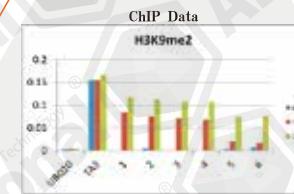

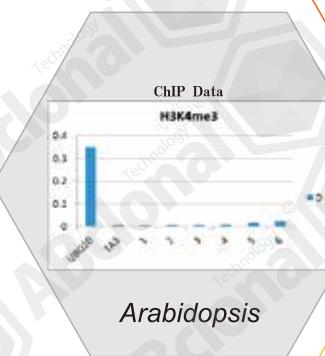

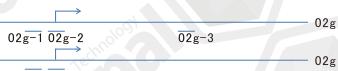

Epigenetics is the study of changes in gene expression that are caused by certain base pairs in DNA or RNA, being “turned off” or “turned on,” through chemical reactions. In biology, epigenetics is the study of heritable changes that do not involve changes to the underlying DNA sequence; to a lesser extent, epigenetics also describes the study of stability and long-term alterations in the transcriptional potential of a cell that are not necessarily heritable.

Epigenetic changes can modify the activation of certain genes, but not the sequence of DNA. Additionally, the chromatin proteins associated with DNA may be activated or silenced. This is why the different cells in a multi-cellular organism only express the genes that are necessary for their own activities.

Plants Histone Modification Antibodies

ABclonal Anti-H3K27me3(A2363)
VS
Company M Anti-H3K27me3 in ChIP-qPCR
 Use Nipponbare callus (same quantity, about 3g) as sample material of ChIP experiment, 0.02g and 0.03g as target gene. Conduct IP experiment using Anti-H3K27me3 (ABclonal-A2363) and Anti-H3K27me3 (Company M). Use Nipponbare callus (same quantity, about 3g) as sample material of ChIP experiment, 0.02g and 0.03g as target gene. Conduct IP experiment using Anti-H3K27me3 (ABclonal-A2363) and Anti-H3K27me3 (Company M).
